

Abstract of the Disclosure

A method for separating a supply of material into  
distinct sections of material, while controlling the  
position and orientation of these distinct sections  
during further manipulation in a continuous process is  
disclosed. The method includes forming a line of  
weakness comprising perforations and scores extending  
substantially from the first edge to the second edge and  
applying a force substantially parallel to the length of  
the web sufficient to separate an individual sheet from  
the web at the line of weakness.
